SERVICE INSTRUCTIONS
OILGEAR TYPE “C2” and “C3” MULTIPLE PRESSURE COMPENSATOR CONTROLS FOR “PVWH” and “PVW” PUMPS

PURPOSE OF INSTRUCTIONS
These instructions have been prepared to simplify and minimize your work of operating Oilgear type “C2” and “C3” controlled units. This material will inform you as to basic construction, principle of operation and service parts listings. Some controls may be modified for specific applications from those described and other changes may be made without notice.

Figure 1. Typical “C2” control for Oilgear “PVWH” and “PVW” pumps (N89-002-04).

PRINCIPLE OF OPERATION

“C2” and “C3” controls are designed for (multiple) independently adjustable pressure (compensator) settings as selected by integral solenoid(s).

Refer to figure 3. The type “C2” dual pressure compensator control provides two pressure settings. When pressure in the delivery line is below the setting of the pressure compensator valve, the control piston cylinder is connected (through the pressure compensator spool) to drain and the control piston spring positions the control for full delivery as shown. With solenoid de-energized and when pressure in the delivery line reaches a pressure high enough to shift the pressure compensator spool against its spring, high pressure is ported into the control cylinder behind the piston which compresses the control piston spring and shifts the pump (swashblock) for reduced delivery until pressure in delivery line holds at the preset pressure compensator valve setting.

When solenoid is energized - the pressure in the pressure compensator valve spring chamber is raised to the level of the high pressure relief valve. This pressure adds to spring setting of the pressure compensator valve, raising the pressure at which the pump compensates (reduces delivery). When pressure reaches the setting of high pressure relief valve, that valve blows and connects the pressure compensator valve spring chamber to drain. Pressure on opposite end of compensator spool positions the spool to allow pressure to enter control cylinder behind the control piston which compresses the control piston spring and reduces pump delivery until pressure in delivery line holds at higher pressure control valve setting. The type “C3” triple pressure compensator control operates on the same principle as the “C2” control.

Standard lower pressure settings (“P1”) can be made from 400 psi (27.6 bar) to 1500 psi (103.4 bar) [other ranges are available] and higher pressure settings (“P2”) and (“P3”) from 900 psi (60 bar) to units rated pressure.
**PARTS LIST**

Parts used in this assembly are per Oilgear specifications. Use Oilgear parts to ensure compatibility with assembly requirements. When ordering replacement parts, be sure to include pump type designation and serial number stamped on nameplate, bulletin and item number. To assure seal and packing compatibility, specify type of hydraulic fluid used.

* Spring side of control piston for “PVWH” 11 thru 20 sizes; for “PVW” sizes 15 thru 60 sizes. Opposite side of control piston for all others.

** Used only for “PVWH” 11 thru 60 sizes, or “PVW” 15 thru 60 sizes.

*** Used only on “PVW” 34-60 units.
