Ordering Information  23
Every Oilgear product is shipped to you with our Performance Assurance — a corporate commitment to stay with your installation until our equipment performs as specified.

Hydraulic equipment and systems have been Oilgear’s primary business since 1921. For decades, we have developed hydraulic techniques to meet the unique needs and unusual fluid power problems of machinery builders and users worldwide, matching fluid power systems to a tremendous range of applications and industries. Our exclusive Performance Assurance program is built upon that strong foundation.

As a customer, you also benefit from access to Oilgear’s impressive technical support network. You’ll find factory trained and field-experienced application engineers on staff at every Oilgear facility. They are backed by headquarters staff who can access the records and knowledge learned from decades of solving the most difficult hydraulic challenges.

When your design or purchase is complete, our service is just beginning. If you ever need us, our Oilgear engineers will be there, ready to help you with the education, field service, parts and repairs to assure that your installation runs smoothly — and keeps right on running.
PVM Open Loop Pumps

Multiple controls available
- A fast shift valve assists pump in coming back on stroke
- All units are shipped with “meter-out” pressure compensated, load sensing control
- Delivers high performance in a compact package

Cylinder mounted in polymerous hydrodynamic journal bearings
- Allows operation with low viscosity or other special fluids
- Provides infinite bearing life
- Enables compact design

SAE Splined or Keyed shaft
- For convenient coupling to your specific rotary power source, heavy-duty shafts allow high through torque capability

One piece polymerous bearing
- Allows running on low viscosity or other special fluids
- Permits constant control reaction with low hysteresis
- Allows high performance in high cyclic applications
- Eliminates troublesome yoke bearings
- Provides long life

Rugged cylinder design
- Hardened nodular iron construction for improved performance and contamination resistance

Patented pressure lubricated swashblock
- Delivers high performance for high pressure high cycle operation
- Provides long life

Hardened cylinder surfaces
- Greater resistance to contamination
- Provides longer life
- Allows operation with low viscosity or other special fluids

Rotation Convertibility
- Right-hand driven pumps are easily converted to left-hand driven pumps or vice versa
- Constant port locations (suction, pressure) regardless of pump rotation

Valve plate selection
- Rear or top and bottom port connections available

Quiet port plate design
- Minimizes noise at typical electric and drive motor speeds
- Low sound levels (see Sound Curves)
- Allows easy inspection and maintenance

Through-shaft availability (after removal of rear cover)
- Full through-shaft torque capability for most units (see Multiple Pump Combinations, Page 22) allows multiple pump installation from single driveshaft
- Close-coupled dual design further provides compact package
- Has provisions for mounting other SAE size pumps, equipment etc.
- Can be used to drive auxiliary devices (see Multiple Pump Combinations, Page 22)
**Plus** the following not shown in the cross section photo

(13) Isolated front shaft bearing
- Enables operation with low viscosity or other special fluids
- Allows side loading

(14) Multiple capacities in each compact frame size
- Permits selection of volume capacity that most closely match your needs while providing maximum control range
- Unitized one-piece nodular iron housing reduces number of potential leak paths

(15) Totally enclosed
- Impervious to high pressure washdown
- Can be operated in hazardous environments with totally enclosed drive motors

(16) Can be easily mounted in any position
- Easy to install
- Dual case drain available for mounting flexibility

(17) Built in purge port
- Aids in purging trapped air from pump during start-up

(18) Designed without gaskets
- All mating surfaces and passages designed with o’ring seals to prevent leakage

### PRESSURE PICK-UP POINTS FOR INSTRUMENTATION

- **HP Port**: #4 Straight Thread SAE Port Internal Control Back Pressure (typical 0 to 100 psi)
- **Remote PC Pressure Port**: #4 Straight Thread SAE Port Pump Control Pressure
- **Pump Suction Port**
- **Pump Outlet Port**
- **Construction Plug**: Various types and sizes of plugs depending on frame size.
- **Flow Reversing Port**: #4 Straight Thread SAE Port Pump Control Pressure (see note below)
- **Standard Load Sense Port**: #4 Straight Thread SAE Port Pump Outlet Pressure for "P-1NN", "P-1NN/J" and "P-1NN/B" type controls. Load Sense Pressure for "P-1NN/F" type control.
- **Purge Port**: #4 Straight Thread SAE Port Case Pressure
- **Construction Plugs** at these locations. These should not be used as pressure pick-ups.

Note: Right-hand Pump shown. Pressure pick-ups at Flow Reversing Ports are reversed for Left-hand units.

Pump Outlet Pressure = Pressure at Outlet of Pump
Pump Control Pressure = Pump Outlet Pressure when pump is at full stroke, will be 150 to 200 psi less than Pump Outlet Pressure when pump control(s) are reducing outlet flow.
Pump Controls*

**Pressure Compensator**

*P-1NN*

Ensures maximum pump flow until unit reaches preset control pressure setting and then regulates output flow to match the requirements of the system while maintaining preset output pressure. Pressure can be adjusted from 350 psi (24.1 bar) working pressure up to the rated pressure of the pump.

---

**Standard Load Sense w/Pressure Compensator**

*P-1NN/F*

A constant output flow is maintained for a given (customer supplied) flow control valve setting regardless of changes in drive speed and/or working pressure. The load sense differential is 180 psi (12.4 bar) and is not adjustable.

---

**Proportional Electronic Pressure Compensator**

*P-AXX*

Pressure compensator setting increases proportionally with an electrical input signal. Pressure can be adjusted from 350 to 3750 psi (24.1 to 259 bar). A manually adjustable override valve is used to set the maximum pressure settings.

---

**Inverse Proportional Electronic Pressure Compensator**

*P-BXX*

Pressure compensator setting decreases proportionally with an electrical input signal. Pressure can be adjusted from 350 to 3750 psi (24.1 to 259 bar). A manually adjustable override valve is used to set the maximum pressure setting. Generally used for fan drive circuits.

---

* Be sure system and pumps are protected, with a high-pressure relief valve, against overloads.

For detailed circuits of a particular size pump and control combination, contact your Oilgear Representative.
Adjustable Load Sense w/Pressure Compensator Override

Adjustable load sense w/pressure compensator “P-1NN/J.”
A constant output flow is maintained for a given (customer supplied) flow control valve setting regardless of changes in drive speed and/or working pressure. The load sense differential is adjustable from 180 to 700 psi (12,4 to 48,3 bar).

Soft Start Pressure Compensator “P-CNN”
Pump starts “softly” by going quickly at low pressure to a reduced flow setting, thereby reducing start-up torque requirement. The “P-CNN” control uses a normally open cartridge that will unload the pump at the minimum pressure setting with no power to the solenoid.

Soft Start Pressure Compensator “P-KNN”
Pump starts “softly” by going quickly at low pressure to a reduced flow setting, thereby reducing start-up torque requirements. The “P-KNN” control uses a normally closed cartridge that will unload the pump at the minimum pressure setting with the solenoid energized.

Adjustable Load Sense w/Pressure Bleed-off & Pressure Compensator Override

Same as “P-1NN/J” except with an internal orifice to vent load sense pressure to drain when the load sense is not active or during shutdown. The load sense differential is adjustable from 180 to 700 psi (12,4 to 48,3 bar).

* Be sure system and pumps are protected, with a high-pressure relief valve, against overloads.
For detailed circuits of a particular size pump and control combination, contact your Oilgear Representative.
Remote Controls for Pressure Compensator Functions

A customer-supplied remote control valve can be easily added to any of the “PVM” pumps allowing pressure adjustment control to be convenient to the operator while the pump may be located convenient to the operated device.

Note: RP (Remote Pressure) lines of multiple pumps cannot be tied together for unloading or controlling with a common remote pressure control valve. A dedicated valve is required for each pump.

For remote pressure control of multiple pumps, see data sheet 47974.
Performance curves are based on a viscosity of 160 SSU.

Two or more Oilgear “PVM” axial piston variable delivery pumps can be integrally coupled together and driven from a single shaft. In most cases (see Specifications) both pumps can be used at full rated output. Pump deliveries can be combined for large volume circuits or deliveries can be used individually. See the following table and calculations for Allowable Thru-shaft Torque.

### How to calculate torque for each pump

\[
T \text{ (in. lbs.)} = \frac{\text{Pressure (psi) x Displacement (cu. in./rev.)}}{5.625}
\]

Add the respective torques for each unit:

- \( T_1 \) = front pump torque required
- \( T_2 \) = second pump torque required
- \( T_n \) = Additional pump or torque for any other driven device

\[
T_1 + T_2 + T_n \quad \text{Sum must be less than } T_{\text{max}} \text{ shown in table}
\]
